Without Guesswork

Types 1, 2, 3 and 4

October 1972

TECHNICAL DATA FOR WORKSHOP USE

This booklet contains all major measurements and adjustments for Volkswagens of the Types 1, 2, 3 and 4 imported into the USA and Canada for the model years 1971, 1972 and 1973.

Use this booklet together with the applicable workshop bulletins and workshop manuals.

f Wheel alignment data

With 14 in. wheels, an angle of 10' equals a toe measurement of 1.1 mm (0.043 in.)
 15 in 1.2 mm (0.047 in.)
 + in front of a track measurement means toe-in, - means toe-out

Test conditions.

- Instrument and wheel mirrors properly set.
- Vehicle empty
- Correct tire pressures (for permissible total weight).
- Suspension free of tension.
- Vehicle aligned correctly.

Remarks

Designation	Value
Type 1 / Sedan 111	
1 - Total toe angle with wheels not pressed	+ 30' ± 15'
2 - Total toe angle with wheels pressed	+ 5' ± 15'
3 - Pressure applied to wheels	10 ± 2 kg (22 ± 4 lb)
4 - Maximum permissible difference between readings with wheels pressed and not pressed	25'
5 - Front wheel camber in straight-ahead position	0° 30' ± 20'
Maximum permissible difference between sides	30'
6 - Toe angle at 20° lock to left and right (wheels not pressed)	to left - 1° 20' ± 30'
	to right - 2° 10' ± 30'
7 - Offset between stub axles	max. 8 mm (0.314 in.)
8 - Caster angle of a wheel	3° 20' ± 1°
9 - Corresponds to the camber difference of a wheel on a 20° lock to left and right	2° 15' ± 40°

Designation	Value	Remarks
Type 1/Sedan 113		
1 - Total toe angle of front wheels, not pressed	+ 30' ± 15'	*) Adjust as close as possible to 1°
2 - Total toe angle of front wheels, pressed	10' ± 15'

5 Front wheel camber in straight ahead position	$1^\circ 20' \pm 20'$	
Maximum permissible difference between sides	$20'$	
6 Toe-out angle at a 20° lock to left and right (wheels not pressed)		
to left	$- 40' \pm 30'$	
to right	$- 10' \pm 30'$	
7 Offset between stub axles	$\text{max } 8 \text{ mm } (0.314 \text{ in})$	
8 - Caster angle of a wheel	$4^\circ \pm 40'$	
equals the camber difference of a wheel on a 20° lock to left and right	$2^\circ 40' \pm 25'$	

Designation	Value	Remarks
9 Rear wheel camber with spring plates properly set (after at least 300 miles)	all models - 1° 20' ± 40'	
Maximum permissible difference between sides	all models 45'	
10 Rear wheel toe angle with correct camber	Model 31 Model 36 + 5 ± 15' 0° ± 15'	
11. Maximum permissible deviation in wheel alignment	max 10'	

Designation	Value	Remarks
Type 4		
1 Total toe angle with wheels not pressed	$+ 20' \pm 15'$	*) Measure only with test appliance VW 361 (three-piece) in position Pointer of VW 361/1 on center of casting rib. **) Take into account lateral angle of vehicle
2 Total toe angle with wheels pressed	$0' \pm 15'$	
3 Pressure applied to wheels	$10 \pm 2 \text{ kg (22} \pm 4 \text{ lbs)}$	
4 Maximum permissible difference between readings with wheels pressed and not pressed	25'	
5 Toe out angle on 20° lock to left and right (wheels not pressed)	$1^\circ 20' \pm 40'$	
6 Camber with wheels straight ahead Maximum permissible difference between sides	$1^\circ 10' + 25' - 30'$ 30'	
7 Caster angle equals the camber difference of a wheel on a 20° lock to left and right	$1^\circ 45' \pm 35'$ $1^\circ 10' \pm 25'$	
8 Stub axle offset	max. 11 mm (0.43 in.)	
9 Total rear wheel toe angle	$+ 10 \pm 15$	
10 Camber of rear wheels Permissible difference between sides	$- 1^\circ \pm 30'$ **) 30'	
11 Maximum permissible deviation in wheel alignment	10'	
12 Drive shaft settings	25 mm (1.0 in.)	
Offset between vehicle center and engine/transmission unit center	25 mm (1.0 in.)	
Center of left measuring hole to center of right measuring hole	$1126 \pm 1 \text{ mm}$ (44.3 \pm 0.04 in.)	
Center of left measuring hole to center of rib on transmission	$588 \pm 0.5 \text{ mm}$ (23.1 \pm 0.02 in.)	
Center of right measuring hole to center of rib on transmission	$538 \pm 0.5 \text{ mm}$ (21.2 \pm 0.02 in.)

g Marking of gear sets

1 Manual transmission Types 1 and 3 and Automatic Stick Shift

(Example Manual transmission with double-joint axle)

- 1 - "G 833" means G eason gear set with a ratio of 8 : 33.
- 2 - Matching number (369) of gear set. *)
- 3 - Deviation "r" based on the master gauge of the special machine used in production. The deviation is given in 0.01 mm with the same sign. For example: "25" means that $r = +0.25$ mm *)
- Ro - Length of master gauge used in special machine, "Ro = 58.70 mm"
- R - Actual measurement between ring gear centerline and end of drive pinion at point of quietest running.

*) From January 1972 not marked in production. Therefore determine "actual" measurements before repair

2 - Manual transmission Type 2

- 1 - "K 843" means Klingelberg gear set with a ratio of 8 : 43
- 2 - Matching number (312) of gear set. *)
- 3 - Deviation "r" based on the master gauge of the special machine used in production. *)
- Ro - Length of master gauge used in special machine "Ro = 63 mm"
- R - Actual measurement between ring gear centerline and end of drive pinion at point of quietest running
- Vo - Hypoid offset ≈ 10 mm.

*) From March 1972 not marked in production. Therefore determine "actual" measurements before repair

3 Manual transmission Type 4

- 1 "G 1141" means Gleason gear set with a ratio of 11 : 41
- 2 Matching No. of gear set (369)
- 3 Deviation "r" based on the master gauge of the special machine used in production
- Ro Length of the gauge used in the special machine "Ro = 41.2 mm"
- R Actual measurement between ring gear centerline and the end of the drive pinion at the quietest running point
- Vo Hypoid offset = 44 mm

4 Automatic transmission Types 2, 3 and 4

- 1 "G 933" means Gleason gear set with a ratio of 9 : 33
- 2 Matching number of gear set (369)
- 3 Deviation "r" based on the master gauge of the special machine used in production
The deviation is given in 0.01 mm with the same sign. For example "26" means that $r = +0.26$ mm
- Ro Length of master gauge used in special machine, "Ro" = 40.55 mm
- R Actual measurement between ring gear centerline and end of drive pinion at quietest running point
- Vo Hypoid offset = 42.5 mm

Adjusting final drive

1 - Manual transmission with swing axle

- 1 Shims S_3 for drive pinion
- 2 Shims S_1 at ring gear end
- 3 Shims S_2 at opposite end
- 4 J depth of housing between ball bearings
- 5 L length of different housing

Explanation of signs

Sign	Designation	Dimension
S_{vo}	Mean backlash	0.20 mm
MR	Measuring ring	—
$\triangle S_1$	Axial movement of ring gear to give specified mean backlash	0.01 mm
S_1	Shim at ring gear end	find thickness
S_2	Shim at opposite end	find thickness
e	Difference between zero setting of mandrel/pinion actual dimension without shims	0.10–0.50 mm
p	Preload on one bearing	0.07 mm
r	Deviation in gear set G 35B/K 835/G 338/K 833	0.05–0.65 mm
E_o	Actual dimension measuring mandrel/setting pin	—

Finding thickness of:

Shim S_3

$$S_3 \text{ nominal} = e + r$$

Shim S_2

$$S_2 = L - S + 2p$$

Shim S_1

$$S_1 = MR + \triangle S_1 + p$$

2 - Manual transmission with double joint axle Types 1 and 3

Explanation of signs

Sign	Designation	Dimension
$S_{vo \text{ mean}}$	Average of several backlash readings	0.01 mm
$\triangle S_1$	Axial movement of ring gear to give specified mean backlash	0.01 mm
S_1	Shim at ring gear end	find thickness
S_2	Shim at opposite end	find thickness
e	Difference between zero setting of measuring mandrel and actual pinion dimension without shims	0.10–0.50 mm
r	Deviation for gear set G 833 / K 833	0.05–0.66 mm
w	Correction factor for gear set G 833	1.00
	Correction factor for gear set K 833	1.10
h	Ring gear lift from full mesh position for G 833 gear set	0.20 mm
	Ring gear lift from full mesh position for K 833 gear set	0.20 mm
E_o	Length of setting pin	58.70 mm

Finding thickness:
Shim S_3

$$S_3 \text{ nominal} = e + r$$

Finding $\triangle S$

$$\triangle S_1 = (S_{vo \text{ mean}} \times w) - h$$

Explanation of signs

Sign	Designation	Dimension
$S_{vo \text{ mean}}$	Average of several backlash readings	0.01 mm
$\triangle S_3$	Axial movement of ring gear to give specified mean backlash	0.01 mm
S_1	Screw-in depth of adjusting ring at ring gear end	—
S_2	Screw-in depth of adjusting ring at opposite end	—
e	Difference between measuring mandrel and setting pin	0.10–0.50 mm
r	Deviation for gear set G 835/K 835	0.05–0.65 mm
w	Correction factor for gear set G 835	1.00
	Correction factor for gear set K 835	1.10
h	Ring gear lift from full mesh position for G 835 gear set	0.20 mm
	Ring gear lift from full mesh position for K 835 gear set	0.22 mm
E_o	Length of setting pin	58.70 mm

Finding thickness:
Shim S_3

$$S_3 \text{ nominal} = e + r$$

Finding $\triangle S_1$

$$\triangle S_1 = (S_{vo \text{ mean}} \times w) - h$$

Explanation of signs

Sign	Designation	Dimension
$S_{vo \text{ mean}}$	Average of several backlash measurements	0.01 mm
ΔS_1	Axial movement of ring gear to give average backlash	0.01 mm
M.S	Measuring shim VW 381/10 (two off)	± 30 mm
S	Movement of tapered roller bearing outer race	0.01 mm
w	Correction factor for individual gear set	—
h	Ring gear lift from no-play mesh position with pinion of individual gear set	0.01 mm
r	Deviation from "Ro", marked on gear set in hundredths of a millimeter	$r \approx 25$ = 0.25 mm
e	Difference between setting pin and mandrel	Measured in mm 0.85—1.30 mm possible

Finding thickness:
Shims S_2 *)

$$S_2 \text{ nominal} = e - r$$

$$S_2 \text{ nominal} = e + r$$

Shim thickness S_1 nominal
and S_2 nominal

$$S_1 \text{ nominal} = M.S - \Delta S_1$$

Determining ΔS_1

$$\Delta S_1 = (S_{vo \text{ mean}} \times w) \cdot n$$

$$S_2 \text{ nominal} = M.S + \Delta S_1$$

*) From Chassis No. 218 000 001 to Chassis No. 218 202 251 the shim is on the ring gear side

**) From Chassis No. 219 000 001 the shim is on the transmission side. The final drive is adjusted with adjusting rings as on Type 1 Automatic Stick Shift

5 Manual transmission Type 4

Explanation of signs

Sign	Designation	Dimension
Svo mean	Average of several backlash measurements	0.01 mm
$\triangle S_1$	Axial movement of ring gear to give average backlash	0.01 mm
S_1	Screw-in depth of adjusting ring at ring gear end	—
S_2	Screw-in depth of adjusting ring at opposite end	—
e	Difference between measuring mandrel and setting pin	0.70–1.20 mm
r	Deviation for gear set G 1141	0.10–0.55
w	Correction factor for gear set G 1141	± 30
h	Ring gear lift from full mesh position for gear set G 1141	0.28 mm
E_0	Length of setting pin	61.2 mm

Finding thickness:

shim S 3

$$S_{3\text{nominal}} = e + r$$

Finding

 $\triangle S_1$

$$\triangle S_1 = (S_{vo\text{ mean}} \times w) - h$$

6 Automatic transmission Types 2, 3 and 4

(On Type 2 the differential and drive pinion are located in the final drive housing. The adjustment of the drive pinion and ring gear is basically the same as on the Types 3 and 4. The shim S_3 is positioned behind the tapered roller bearing inner race.)

Explanation of signs

Sign	Designation	Dimension
S_1	Screw-in depth of adjusting ring at ring gear end	40.55 mm
S_2	Screw-in depth of adjusting ring at opposite end	
S_3	Shim between taper roller bearing and drive pinion	
R_0	Length of master gauge used in special test machine	
R	Location of pinion in relation to centerline of ring gear at quietest running point (nominal dimension)	$R = R_0 + r$
r	Deviation from " R_0 ", marked on gears	0.15–0.25 mm
S_{vo}	Backlash	42.5 mm
V_0	Hypoid offset	ratio = 3.87
G 933	Gear set G = Gleason 933, No. of teeth 33/9	$D/2 = 10.00$ mm
$D/2$	Half diameter of mandrel	$E_0 = 50.55$ mm
E_0	Length of setting pin VW 380/3 $E_0 = R_0 + D/2$ mm	
e	Difference between mandrel and setting pin	measured in mm

Finding thickness:

$$\text{Shim } S_3 = e - r$$
